

Protect Surfaces Against Bacteria

Ask us about creative solutions for your space

Protection against bacteria is critical in the current climate, Dry Erase is a gloss film which can be used as a protective barrier on signs and surfaces in environments where high levels of hygiene are essential.

It has a non-porous gloss surface, which means that any bacteria or contaminants sit on the surface and do not penetrate into the film.

Dry Erase **does not absorb or retain any undesirable germs** and it is easily cleaned using chemicals and disinfectants without damaging the surface.

With its bacteria resistant properties, Dry Erase provides a protective coating for graphics and signage in environments such as medical, food industries, public spaces and school environments. Push/pull signs on doors, timetables, any situation that experiences public touch-points and physical contact.

Dry Erase can also be **used as a whiteboard** surface and can be written on time and time again with standard whiteboard markers. Great for updating messages as needed.

Ideal for Hospitals, Medical Centres, Service Stations, Banks, Post-offices, Supermarkets, Transport and Transit environments, Childcare Centres, Pharmacies and other environments where hygiene considerations are paramount.
